

## Case Study: Speedibake

Surface Technology, a world leader in the application of high performance surface treatments, continue to strengthen the manufacturing system of Speedibake, one of the UK's biggest manufacturers of speciality bread products by working through the night to help them maintain production levels.

By working around the clock over the course of a weekend, Surface Technology collect, coat and redeliver the dough and divider hoppers which form an integral part of every Speedibake production line to enable normal business activity to resume by the following Monday morning.

*Armourcote has over 40 yrs experience*

Over the past four years, Surface Technology have helped to improve the efficiency of Speedibake's production line by coating their dough and divider hoops with reinforced Armourcote® 1530.

This coating is reinforced with a flame applied stainless steel matrix which gives it an extended life service and outstanding release properties. This results in a lower level of friction and improved abrasion resistance.

The Armourcote® brand is part of Surface Technology PLC which has over 40 years' experience in the development and application of high performance surface treatments. Their expertise includes release coatings, protection coatings, friction coatings and anti-corrosion coatings, along with treatments for durability and temperature tolerance.

Commenting on the commitment displayed by Surface Technology, Paul Langton, the Maintenance Manager at Speedibake, said:

*"We have always been extremely happy with the service and quick turnaround demonstrated by Surface Technology and their specialist coatings have helped to improve the efficiency of our production line."*
