

Case Study: Warburtons

Surface Technology, a world leader in the application of high performance surface treatments, continue to strengthen the production system of Warburtons, one of the UK's largest manufacturers of bread, by applying a specialist coating to their machines to enhance the quality of its performance.

Warburtons, who are based in Wakefield and Bolton, have worked with Surface Technology for the last 20 years after their specialist coating services were employed by food equipment manufacturer Baker Perkins.

Their expertise includes release & friction coatings...

The Armourcote® brand is part of the Surface Technology PLC which has over 40 years' experience in the development and application of high performance surface treatments.

Their expertise includes release coatings, protection coatings, friction coatings and anti-corrosion coatings, along with treatments for durability and temperature tolerance.

By coating their dough hoppers and divider hoppers with reinforced Armourcote® 1530, a coating reinforced with a flame applied stainless steel matrix, Surface Technology are able to provide Warburtons with a coating which offers the same level of quality as that of their original Baker Perkins' equipment.

Commenting on Warburtons and Surface Technology's working relationship, Steve Moor, Warburton's chief engineer comments:

"We have always been very impressed with the technical confidence displayed by Surface Technology and they have always provided us with excellent commercial feedback and competitive prices. Over the years, we have dealt with Surface Technology directly and have found that cutting out the middleman has streamlined our production system and made it much more efficient."
